

Wilfley

Recirculation / Transfer Application

Wilfley Dynamic Seal:

33' maximum tank suction

60% solids, 1.58 SG

No seal water required

In a remote “unattended” application, this pump is required to operate at varying conditions. Viewed above, the pump had completed transferring the contents, but was left operating in recirculation mode. With the tank almost empty, the pump was surging in flow from air entering the suction. No damage was sustained to the pump or dynamic seal in this severe service.
